CHAPTER 1

INTRODUCTION

1.1 OVERVIEW

The Internship Application Management System is a web-based application developed using the Salesforce platform to streamline and manage the internship application process within an educational institution. The system provides a centralized platform where students can apply for internships, track their application status, and receive approvals through an organized workflow.

Internship applications are handled manually through paper-based forms. This method can lead to delays, data loss, and lack of transparency in the approval process. The proposed system addresses these issues by digitizing the entire internship application process and enabling efficient management through an automated platform. In this system, students can submit internship applications by providing necessary details such as company name, department, start date, and end date.

Once the application is submitted, it follows a structured approval workflow involving the Department Placement Officer, HOD and the College Placement Officer. Each officer reviews the application and either approves or rejects it based on institutional guidelines. In case of rejection, the system records the rejection reason so that students can understand the issue and take corrective action if necessary. This structured workflow ensures transparency and accountability at each level of approval, making the process more reliable. It also helps maintain proper documentation of decisions, enabling better tracking and future reference of internship applications.

The application is implemented using Salesforce Experience Cloud, which enables role-based access for different users including students, department placement officers, Head of the Department and college placement officers. Overall, the Internship Application Management System improves efficiency, transparency, and accuracy in managing internship applications while providing a structured and automated approval workflow within the institution.

1.2 EXISTING SYSTEM

In many educational institutions, the internship application process is traditionally managed using manual method such as paper-based form. Students are required to fill out physical forms or submit internship details through email to the concerned department or placement office. These applications are then reviewed manually by faculty members or placement officers. This manual approach often leads to several challenges. One of the major issues is the lack of a centralized system to manage and track internship applications.

Since records are maintained manually, it becomes difficult to store, retrieve, and update information efficiently. There is also a higher possibility of data loss, duplication, or errors during the documentation process. Another limitation of the existing system is the delay in the approval process. The application forms must pass through multiple levels of approval such as the Department Placement Officer, Head of the Department (HOD), and the College Placement Officer. When handled manually, this process can be time-consuming and may result in communication gaps between students and the approving authorities.

The students often face difficulties in tracking the status of their internship applications. Since the process is not automated, students may need to repeatedly contact the department or placement office to know whether their application has been approved or rejected. This lack of transparency can lead to confusion and inefficiency. Due to these limitations, there is a need for a more efficient and automated system that can simplify the internship application process, improve transparency, and provide better management of student internship records.

1.3 DRAWBACKS OF EXISTING SYSTEM

The existing internship application system has several limitations.
The main drawbacks are:

- The internship application process is manual and time-consuming.
- Students cannot easily track the status of their applications.
- Managing records using paper or spreadsheets is difficult.
- There is a higher chance of data loss or errors in manual records.
- There is no centralized system to store internship information.
- Monitoring and managing internship applications becomes difficult.

1.4 PROPOSED SYSTEM

The proposed system is the Internship Application Management System, which is designed to overcome the limitations of the existing manual process. This system provides a digital platform where students can easily submit and manage their internship applications. In this system, students can apply for internships by entering the required details such as company name, department, start date, and end date through an online portal. The application is then sent through a structured approval process involving the Department Placement Officer, Head of the Department, and the College Placement Officer.

The system allows students to track the status of their internship applications in real time. If an application is rejected, the rejection reason is recorded so that the student can understand the issue and make necessary corrections if required. The proposed system is implemented using Salesforce Developer Account, which provides role-based access to different users such as students, department placement officers, HOD, and college placement officers. Each user can access only the features related to their role. By automating the internship application process, the proposed system reduces manual work, improves transparency, ensures proper record management, and provides a more efficient way to manage internship applications within the institution.

In addition to these features, the system also supports organized data storage and easy retrieval of internship records, which helps in maintaining a centralized database for all internship-related activities. The use of validation rules ensures that only correct and complete information is submitted by students, thereby reducing errors and inconsistencies in the data. The approval workflow ensures that every application passes through the necessary levels of verification, maintaining accuracy and accountability in the process.

The system enhances communication between students and authorities by providing clear status updates and structured processing of applications. It also supports monitoring of internship progress through additional modules such as learning logs, enabling institutions to evaluate student performance during the internship period. Overall, the proposed system provides a reliable, scalable, and user-friendly solution that improves the overall efficiency of internship management and supports better decision-making within the institution.

Each user can access only the features related to their role. By automating the internship application process, the proposed system reduces manual work, improves transparency, ensures proper record management, and provides a more efficient way to manage internship applications within the institution.

1.5 ADVANTAGES OF PROPOSED SYSTEM

The proposed Internship Application Management System offers several advantages over the existing manual system. The major advantages are listed below:

- Automation of Internship Applications: The system allows students to submit internship applications online, reducing manual paperwork.
- Faster Approval Process: The approval workflow enables Department Placement Officers, HOD, and College Placement Officers to review and approve applications efficiently.
- Improved Transparency: Students can track the status of their internship applications in real time.
- Centralized Data Management: All internship-related information is stored in a single system, making it easy to manage and retrieve records.
- Reduced Errors: Automated data entry and validation reduce the chances of mistakes and data loss.
- Role-Based Access Control: Different users such as students, department officers, HOD, and placement officers can access only the information relevant to their roles.
- Better Monitoring of Applications: The system helps administrators easily monitor and manage internship applications within the institution.

SUMMARY

This chapter introduced the Internship Application Management System and explained the need for a digital platform to manage internship applications efficiently. It discussed the existing manual system and its drawbacks such as delays, lack of transparency, and poor record management. The chapter also presented the proposed system, which automates the internship application and approval process using Salesforce Experience Cloud. By providing centralized data management, real-time status tracking, and role-based access for different users, the proposed system improves efficiency, transparency, and overall management of internship applications within the institution.

CHAPTER 2

SYSTEM ANALYSIS

2.1 IDENTIFICATION ON NEED

The internship application process in many educational institutions is still managed manually using paper forms or spreadsheets. This method makes it difficult to manage large numbers of applications efficiently and often results in delays, errors, and lack of proper communication between students and placement officers.

Students face difficulties in submitting internship details and tracking the status of their applications. At the same time, department placement officers and college placement officers find it challenging to manage and review multiple internship applications manually. Maintaining records and monitoring internship approvals also becomes complicated when handled through traditional methods.

Therefore, there is a clear need for an automated system that can simplify the internship application process and provide better management of student internship records. The Internship Application Management System is designed to address these issues by providing a centralized digital platform where students can submit internship applications and officers can review and approve them efficiently. This system helps improve transparency, reduce manual work, and ensure proper management of internship-related information within the institution.

2.2 FEASIBILITY STUDY

A feasibility study is an important step in system development that helps determine whether a proposed system is practical and beneficial for implementation. It evaluates various factors such as resources, cost, time, and technology required to develop and operate the system successfully. In the case of the Internship Application Management System, the feasibility study is conducted to analyse whether the system can effectively solve the problems faced in the existing manual process of internship application management. It helps in understanding whether the proposed system can be implemented with the available resources and whether it will provide improvements in efficiency, transparency, and data management.

2.2.1 Economic Feasibility

Economic feasibility evaluates whether the proposed system is cost-effective and beneficial compared to the existing manual system. The Internship Application Management System is developed using the Salesforce platform, which reduces the need for additional hardware or infrastructure. The system mainly requires internet access and basic computing resources that are already available in most educational institutions. By automating the internship application process, the system reduces paperwork, manual record maintenance, and administrative effort. Therefore, the cost involved in implementing and maintaining the system is minimal when compared to the benefits such as improved efficiency, reduced errors, and better management of internship data.

2.2.2 Operational Feasibility

Operational feasibility determines whether the proposed system can be effectively used by the people involved in the organization. The Internship Application Management System is designed with a user-friendly interface that allows students and officers to easily access and manage internship applications. Students can submit internship details through the portal, while Department Placement Officers, Head of the Department (HOD), and College Placement Officers can review and approve applications through a structured workflow. Since the system simplifies the existing process and provides clear functionality for each user role, it is easy to operate and suitable for implementation within the institution.

2.2.3 Technical Feasibility

Technical feasibility examines whether the required technology and technical resources are available to develop and maintain the system. The proposed system is implemented using Salesforce Experience Cloud, which provides a reliable and scalable platform for building web-based applications. The platform supports features such as data management, approval workflows, automation using flows, and secure role-based access. Since Salesforce provides built-in tools and cloud infrastructure, the system can be developed and deployed without requiring complex technical setups. Therefore, the project is technically feasible and can be implemented effectively using the available technology. The platform ensures high availability, data security, and regular updates, which enhance system performance and reliability. It also allows easy customization and future enhancements

2.3 SOFTWARE REQUIREMENT SPECIFICATIONS

Software Requirement Specifications (SRS) describe the software and hardware requirements needed to develop and run the proposed system. It provides a clear understanding of the tools, technologies, and resources required for the successful implementation of the Internship Application Management System.

2.3.1 Software Requirements

The software requirements specify the applications and technologies needed to develop and operate the system. The main software used for developing the Internship Application Management System includes:

- Operating System: Windows 10 or above
- Platform: Salesforce Platform
- Development Environment: Salesforce Developer Edition
- Technology Used: Salesforce Experience Cloud, Flows, Approval Process
- Browser: Google Chrome / Microsoft Edge
- Documentation Tool: Microsoft Word

These software tools help in designing, developing, and managing the internship application system efficiently.

2.3.2 Hardware Requirements

Hardware requirements refer to the physical components needed to run the system smoothly. The minimum hardware requirements for the proposed system are:

- Processor: Intel Core i3 or above
- RAM: 4 GB or higher
- Hard Disk: 250 GB or higher
- Display: Standard monitor with internet connectivity
- Input Devices: Keyboard and Mouse

These hardware components are sufficient to develop, deploy, and use the Internship Application Management System effectively.

2.4 SOFTWARE DESCRIPTION

2.4.1 Front End

The front end of the Internship Application Management System is developed using Salesforce Experience Cloud. It provides a web-based user interface that allows users to interact with the system through an online portal. The frontend acts as the communication layer between the users and the system. Through the portal, students can submit internship applications, upload required details, and track the status of their applications.

Department Placement Officers, Head of the Department, and College Placement Officers can log into the system to review applications and approve or reject them based on the institution's guidelines. Salesforce Experience Cloud provides a secure, responsive, and user-friendly environment that allows users to access the system through a web browser from any location. This makes the system easy to use and ensures efficient management of internship applications within the institution.

2.4.2 Back End

The back end of the Internship Application Management System is implemented using the Salesforce Lightning Platform and Cloud-Based CRM. The back end is responsible for managing the core functionality of the system, including data processing, business logic, and system operations. In this system, the Salesforce Lightning Platform is used to create custom objects, fields, and relationships required for managing internship application data. Features such as validation rules, approval processes, and flows are used to automate the application submission and approval workflow.

The cloud-based CRM capabilities of Salesforce help in managing student records, internship details, and approval information efficiently. The back end also ensures secure data storage, proper access control, and smooth communication between the system components. This platform provides scalability, reliability, and security, making it suitable for developing and managing the Internship Application Management System.

2.4.3 Database

The database used in the Internship Application Management System is the Salesforce Cloud Database. It is a cloud-based database that stores all the information related to internship

applications, student details, approval status, and internship records. The Salesforce Cloud Database allows data to be stored, managed, and accessed securely through the Salesforce platform. It supports real-time data updates and ensures that all internship-related information is organized and easily retrievable.

The database uses custom objects and fields to store and manage data required for the system. Since the database is cloud-based, it provides advantages such as secure data storage, automatic backup, and easy accessibility from different locations through the internet. This ensures that authorized users can access and manage internship application data efficiently while maintaining data security and integrity.

SUMMARY

This chapter explained the system analysis of the Internship Application Management System. It discussed the need for the system and the feasibility study conducted to determine whether the proposed system is practical and beneficial. The chapter also described the software and hardware requirements required for developing and running the system. In addition, the system architecture was explained by identifying the front end, back end, and database components used in the application. Overall, this chapter provides a clear understanding of the technical structure and requirements needed to implement the proposed system effectively.

CHAPTER 3

SYSTEM DESIGN

3.1 MODULE DESCRIPTION

The Internship Application Management System is divided into several modules to ensure proper organization and efficient functioning of the system. Each module performs specific tasks and manages different activities related to internship applications.

The following modules are included in the Internship Application Management System:

- Student Module
- Department Placement Officer Module
- Head of the Department (HOD) Module
- College Placement Officer Module
- Internship Learning Log Module
- Report and Dashboard Module
- Admin Module

3.1.1 Student Module:

The Student Module is designed for students to submit and manage their internship applications. Through this module, students can enter internship details such as company name, department, start date, and end date. Students can also upload necessary information related to their internship.

Once the application is submitted, students can track the status of their application through the system. They can view whether the application is pending, approved, or rejected. If the application is rejected, the student can also view the rejection reason provided by the placement officer. After the internship application is approved, students can access the Internship Learning Log to record their internship progress, including tasks performed, skills learned, and challenges faced during the internship period.

3.1.2 Department Placement Officer Module:

The Department Placement Officer Module is responsible for reviewing the internship applications submitted by students. In this module, the Department Placement Officer verifies the details provided by the students, such as company information, internship duration, and other related details.

After reviewing the application, the officer can either approve or reject it based on the department guidelines. If the application meets the requirements, it is forwarded to the next level for further approval. If there are any issues with the application, the officer can reject it and provide a rejection reason. This module helps ensure that the internship applications are properly verified at the departmental level before proceeding to the higher approval authority.

3.1.3 Head of the Department (HOD) Module:

The Head of the Department (HOD) Module is responsible for reviewing the internship applications after they have been approved by the Department Placement Officer. In this module, the HOD verifies whether the internship details follow the academic guidelines and departmental requirements. The HOD carefully examines the internship information provided by the student and ensures that the internship is relevant to the student's course or department.

After reviewing the application, the HOD can either approve or reject it based on the department policies. If the application is approved by the HOD, it is forwarded to the College Placement Officer for final approval. If any issues are identified, the HOD can reject the application and provide a reason for the rejection.

3.1.4 College Placement Officer Module:

The College Placement Officer Module is responsible for the final approval of internship applications. In this module, the College Placement Officer reviews the applications that have already been approved by the Department Placement Officer and the HOD. The officer verifies the internship details such as company information, internship duration, and other necessary requirements according to the institution's policies. After reviewing the application, the CPO can either give final approval or reject the application.

Once the application is approved, the student is allowed to proceed with the internship process and access the internship learning log. This module ensures that all internship applications are properly verified before final approval.

3.1.5 Internship Learning Log Module:

The Internship Learning Log Module allows students to record and maintain their internship progress after their internship application has been approved. In this module, students can update details about the work they have performed during their internship. Students can enter information such as the week number, new skills learned, challenges faced, and other internship-related activities.

This helps in maintaining a proper record of the student's internship experience and learning outcomes. Faculty members or placement officers can also review the learning logs to monitor the student's progress during the internship period. This module ensures that the internship activities are properly documented and helps in evaluating the student's practical learning experience.

3.1.6 Report and Dashboard Module:

The Report and Dashboard Module helps administrators and placement officers analyse and monitor internship application data effectively. This module provides summarized information about the internship applications submitted by students. Through reports, users can view details such as the total number of applications, approved applications, rejected applications, and pending approvals.

The dashboard presents this information in the form of charts and graphs, making it easier to understand the overall status of internship activities. This module helps administrators track the performance of the internship management system and supports better decision-making by providing clear and organized insights into internship application data.

3.1.7 Admin Module:

The Admin Module is responsible for managing and controlling the overall functionality of the Internship Application Management System. The administrator manages user accounts, system settings, and ensures that the system operates smoothly.

Through this module, the administrator can create and manage user roles such as students, Department Placement Officers, Head of the Department (HOD), and College Placement Officers. The admin can also monitor system activities and maintain data security. This module plays an important role in maintaining the system, controlling user access, and ensuring that the internship application process functions efficiently.

3.2 DATA FLOW DIAGRAM

A Data Flow Diagram (DFD) is a graphical representation that shows the flow of data through a system. It illustrates how data moves from one entity to another, how it is processed, and how it is stored. DFDs help in understanding the overall system functionality and interactions between external entities and internal processes.

3.2.1 DFD Level 0

DFD Level 0 provides a high-level overview of the system's data flow by representing the system as a single process and showing interactions with external entities. It focuses on major data exchanges without detailing internal processing steps.

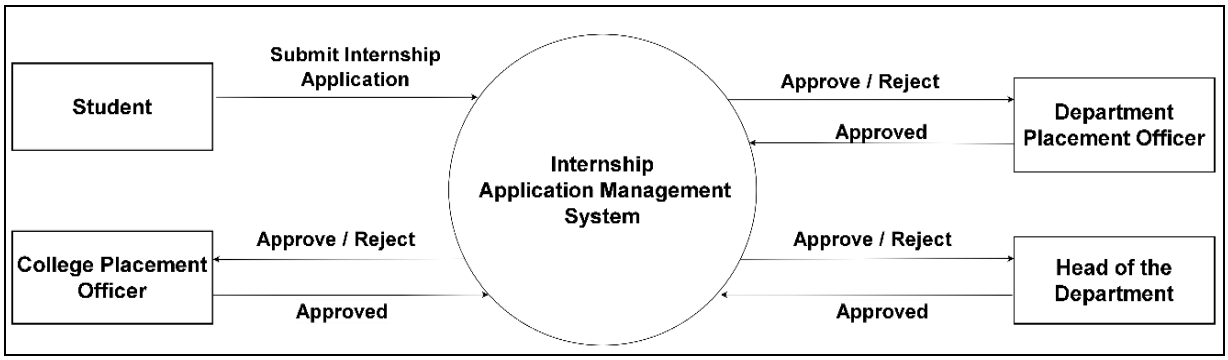

Fig 3.1 Data Flow Diagram Level 0

The DFD Level-0 represents the Internship Application Management System as a single central process that interacts with external entities involved in the internship approval workflow.

In this diagram, the student is the primary user who interacts with the system to submit internship applications and view the approval status. The internship application is processed by the system and forwarded for approval. The Department Placement Officer (DPO)

reviews the submitted internship application details and verifies the information. After verification, the officer can approve or reject the request. The decision is sent back to the system for further processing.

Next, the application is sent to the Head of the Department (HOD) for higher-level approval. The HOD evaluates the request and provides the final departmental decision, either approving or rejecting the internship application. The College Placement Officer (CPO) monitors internship activities at the college level. The system forwards the approved internship information to the CPO for record maintenance and monitoring of internship participation across departments.

The Internship Application Management System acts as the central processing unit that manages the internship workflow, coordinates communication between different entities, records approvals or rejections, and provides the final internship status. Thus, the Level-0 DFD highlights the overall interaction between the student, department authorities, and placement officers with the internship management system.

3.2.2 DFD Level 1

The DFD Level-1 diagram of the Student Internship Application Management System explains the internal processes involved in managing internship applications after breaking down the main system shown in Level-0. It illustrates how internship applications move through different stages such as submission, verification, approval, logging, and reporting while interacting with various users like the Student, Department Placement Officer (DPO), Head of the Department (HOD), and College Placement Officer (CPO). It also shows how data is stored and retrieved from the data stores.

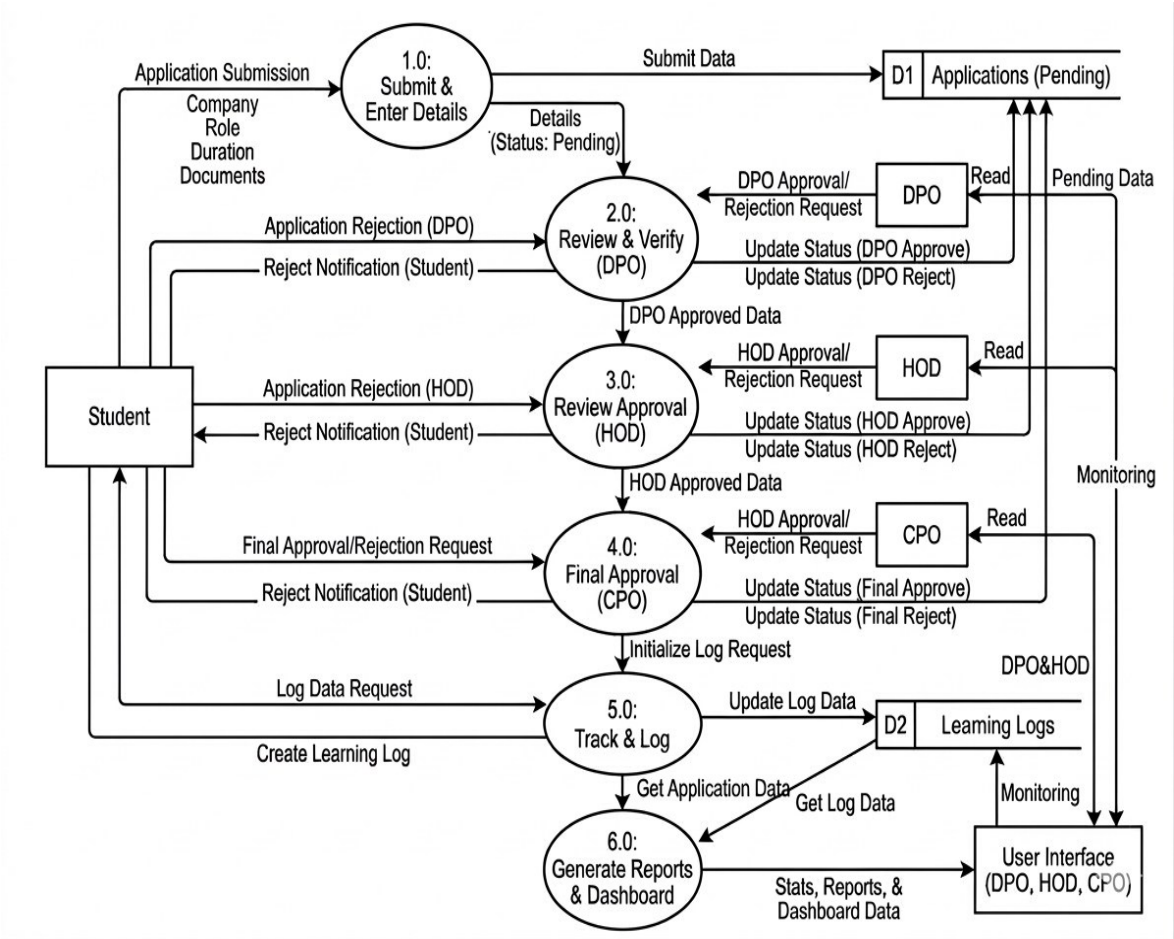

Fig 3.2 Data Flow Diagram Level 1

Initially, the process "Submit and Enter Details (1.0)" allows the student to submit internship application information including company name, role, duration, and supporting documents. Once the student submits the details, the system records the information in the Applications (Pending) data store (D1) with the status marked as pending. This stored information is then forwarded to the next stage for verification.

The process "Review and Verify (2.0)" is handled by the Department Placement Officer (DPO). In this stage, the system retrieves the pending application data from the applications database and sends it to the DPO for review. The DPO checks the submitted internship information and decides whether to approve or reject the request. If the application is rejected, the system sends a rejection notification to the student. If approved, the verified data is forwarded to the next stage for departmental approval and the status in the database is updated.

After the DPO approval, the application proceeds to “Review Approval (3.0)”, where the Head of the Department (HOD) reviews the verified internship application. The HOD ensures that the internship is relevant to the student's academic program and department guidelines. Similar to the previous stage, the HOD can either approve or reject the application. If rejected, the system informs the student. If approved, the application moves to the final approval stage.

The process “Final Approval (4.0)” is performed by the College Placement Officer (CPO). In this stage, the CPO reviews the internship application and provides the final decision. Once the application receives final approval, the system updates the application status in the database and initiates the internship monitoring phase. If the application is rejected at this stage, the system sends a rejection notification to the student.

After the internship is approved, the system enables the “Track and Log (5.0)” process. In this stage, the student can create and update learning logs describing the work performed during the internship. These logs are stored in the Learning Logs data store (D2). The DPO and HOD can access and monitor these logs to track the student's internship progress.

Finally, the “Generate Reports and Dashboard (6.0)” process collects data from both the Applications database and the Learning Logs database to generate statistical reports and dashboards. These reports provide insights into internship applications, approvals, and student progress. The generated reports and dashboard information are made available through the user interface used by the DPO, HOD, and CPO for monitoring and analysis.

Thus, the Level-1 DFD describes the complete workflow of the internship application process, showing how applications are submitted by students, verified and approved by departmental authorities, tracked through learning logs, and finally summarized through reports and dashboards.

3.3 SYSTEM FLOW DIAGRAM

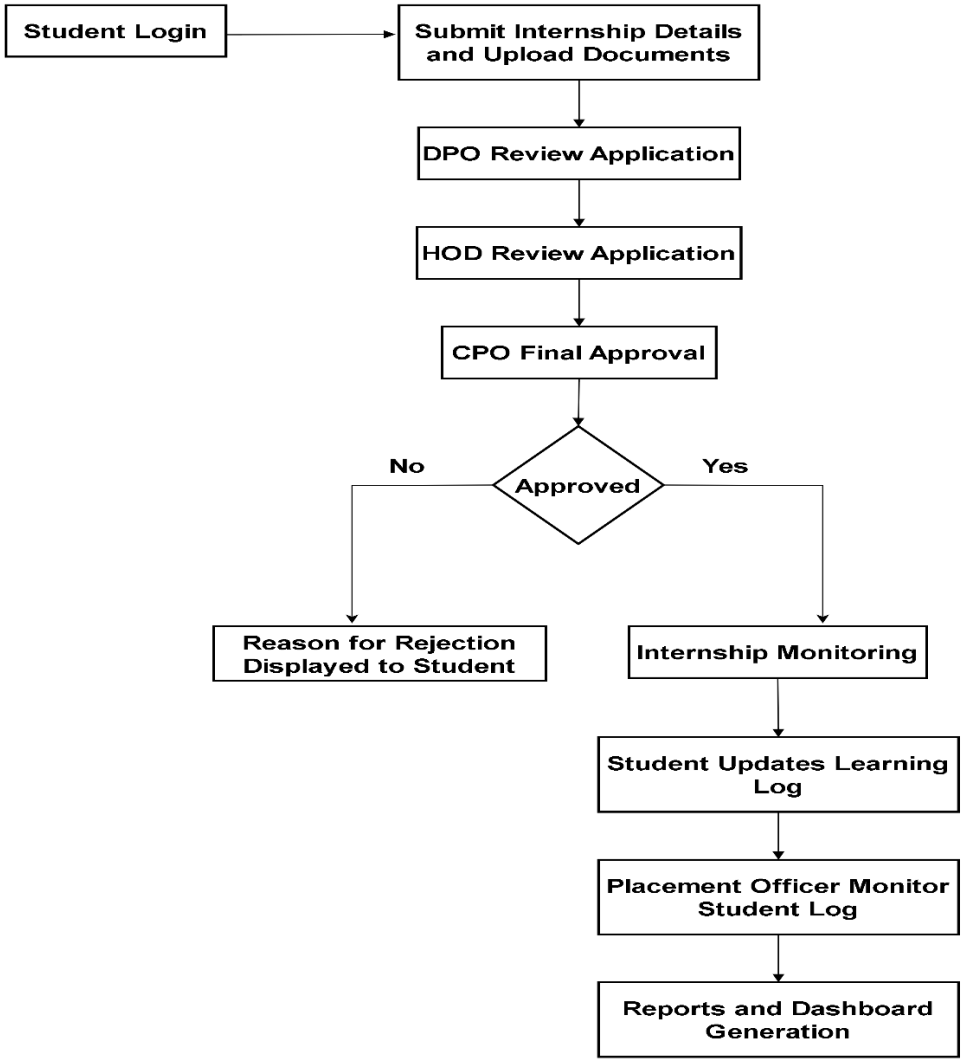

Fig 3.3 System Flow Diagram

The System Flow Diagram describes the complete workflow of the Internship Management System in Salesforce. First, the student logs into the system and submits internship details along with required documents. The application is then reviewed in multiple stages through an approval process: first by the Department Placement Officer (DPO), then by the Head of the Department (HOD), and finally by the College Placement Officer (CPO) for final approval. If the application is rejected at any stage, the reason for rejection is displayed to the student. If the application is approved, the internship enters the monitoring phase, where the student regularly updates their internship learning log. The placement officer monitors the submitted logs to track the student's progress during the internship. Finally, the system generates reports and dashboards that provide insights into internship applications, approvals, and student internship progress.

3.4 INPUT DESIGN

Input design focuses on the methods used to capture and enter data into the Internship Management System in an accurate and efficient manner. The system is designed with user-friendly input forms to ensure that students and administrators can easily provide the required information without errors. The main inputs include student details, internship application information, company details, and internship learning log updates. Validation rules are applied to ensure that mandatory fields such as student ID, company name, internship title, and application dates are correctly entered. The system also allows students to upload supporting documents related to their internship applications.

Proper input design helps reduce data redundancy, ensures data accuracy, and improves the overall efficiency of the system. Each module has specific input forms, such as the student internship application form, learning log submission form, and officer approval forms, which allow authorized users to enter and update relevant information. By implementing structured input screens and validation mechanisms, the system ensures that only valid and consistent data is stored in the database, thereby supporting smooth processing and reliable system operation.

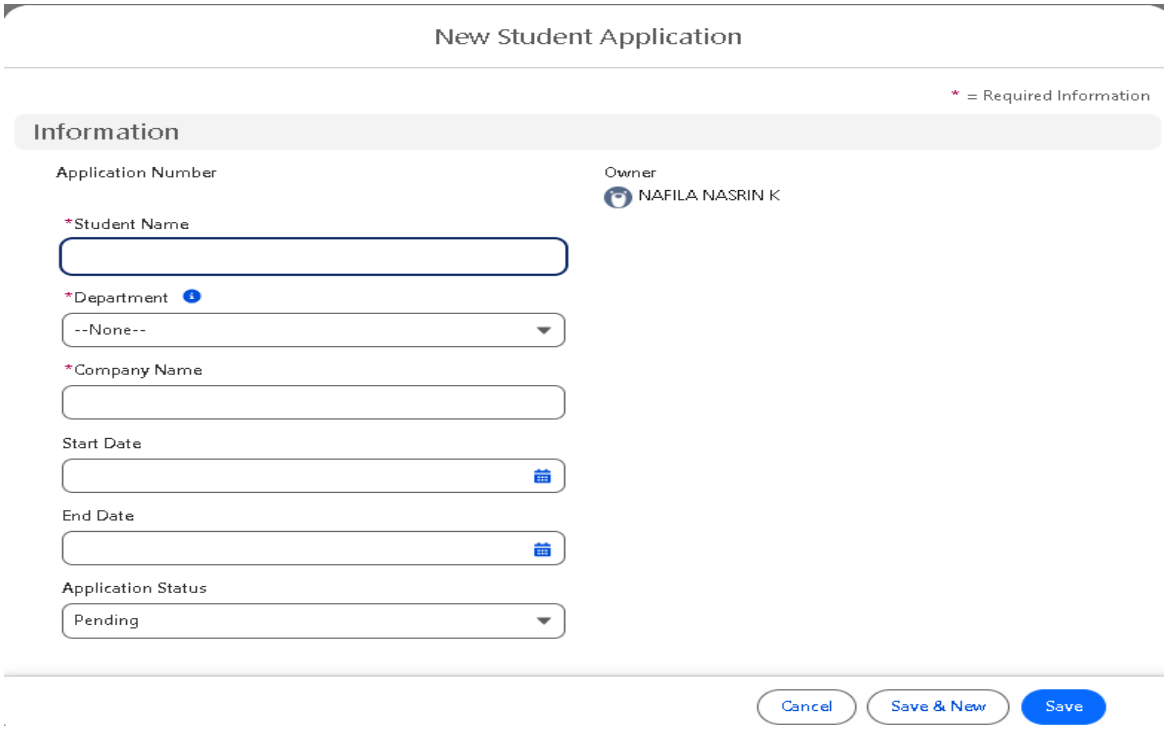

Fig 3.4 Student Internship Application Form

The Student Internship Application Form is used by students to enter and submit their internship details in the system. In this form, students provide information such as Student Name, Department, Company Name, Start Date, End Date, and Application Status. Some fields are marked as required to ensure that all important details are entered correctly before submitting the application.

This form is the first step in the internship application process. After the student submits the form, the application is sent for review and approval by the Department Placement Officer, HOD, and College Placement Officer. This helps the system collect and manage internship information in an organized way.

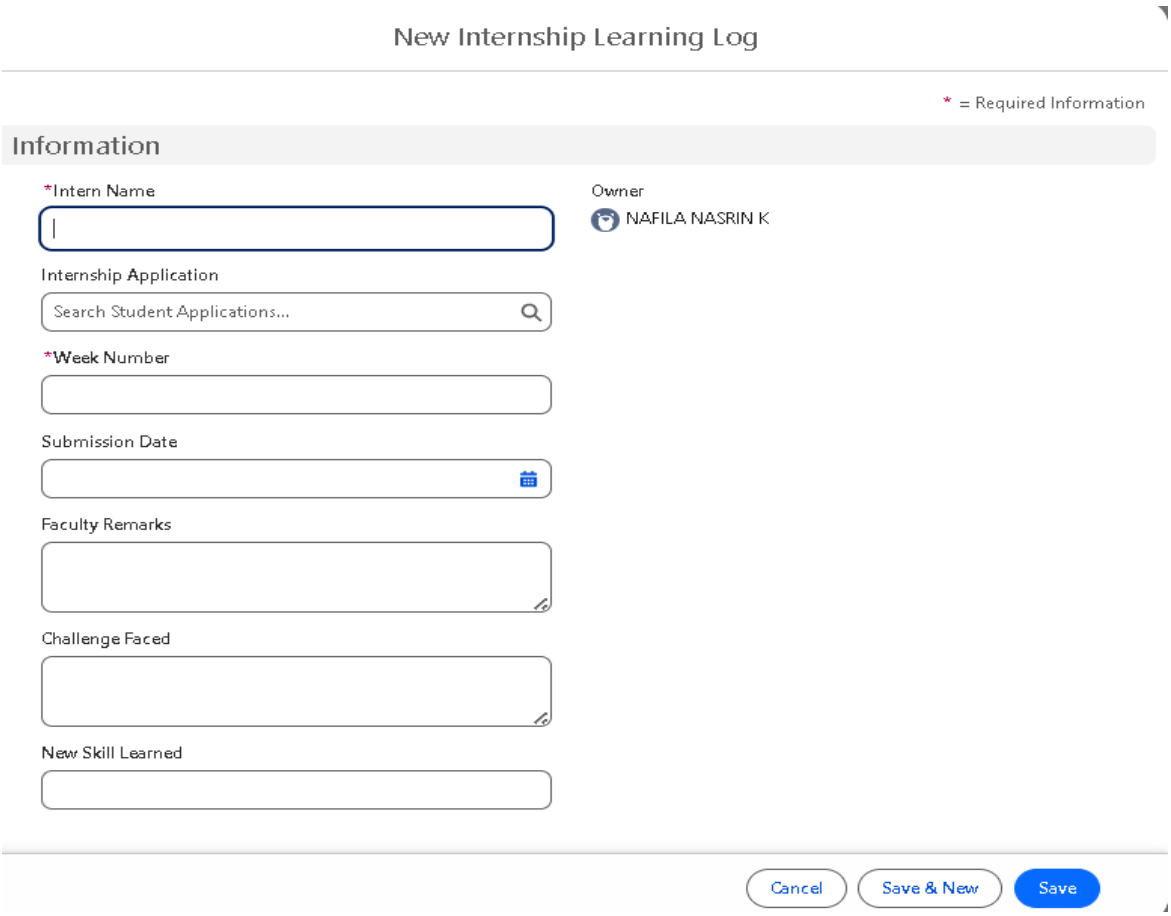

Fig 3.5 Internship Learning Log Form

The Internship Learning Log Form is used by students to record their weekly internship progress in the system. In this form, students enter details such as Intern Name, Internship Application, Week Number, Submission Date, Faculty Remarks, Challenges Faced, and New Skills Learned. These fields allow students to describe the work they completed and the skills they gained during their internship.

This form helps the system track the learning progress of students during their internship period. The submitted logs can be viewed by placement officers or faculty members to monitor student performance and ensure that the internship activities are properly documented.

3.5 OUTPUT DESIGN

Output design focuses on how the system presents processed information to users in a clear and meaningful format. In the Internship Management System, outputs are generated in the form of reports, dashboards, and status updates that help users understand the results of the system's processing. The system provides outputs such as internship application status, student internship details, company internship records, and internship learning log progress. These outputs help students, placement officers, and administrators easily view and analyze internship-related information.

The system also generates reports and dashboard charts to summarize important data, such as the number of approved or pending applications and the progress of student internships. These outputs help administrators monitor the internship activities of students and make better decisions. Proper output design ensures that information is displayed in a structured, accurate, and user-friendly format, allowing users to quickly access and understand the required details.

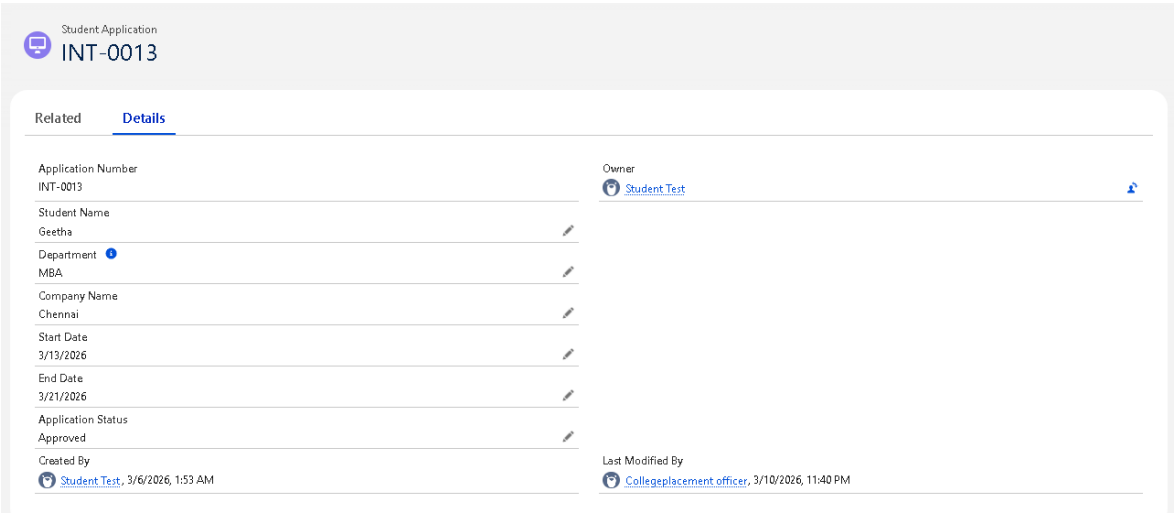

Fig 3.6 Internship Application Status Page

The Internship Application Status Page displays the details of a student's submitted internship application. It shows important information such as Application Number, Student Name, Department, Company Name, Start Date, End Date, and Application Status. This page allows users to view the current status of the internship application after it has been submitted and processed in the system.

This page helps students and administrators easily track the approval progress of the internship application. Once the application is reviewed by the placement officers and HOD, the status is updated and displayed on this page, allowing students to know whether their application is approved, pending, or rejected.

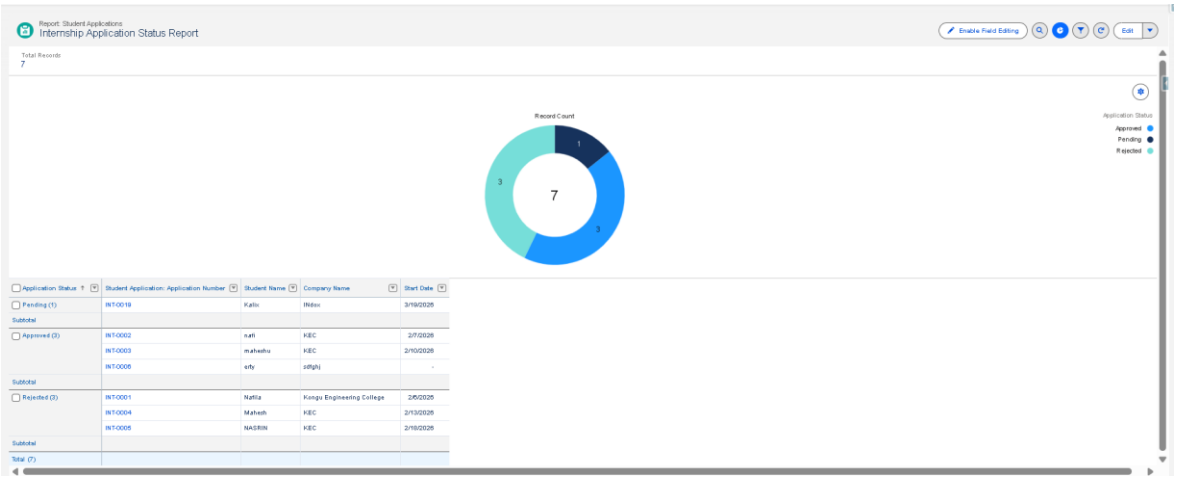

Fig 3.7 Report Page

The Report Page displays summarized information about internship applications in the system. It shows details such as application number, student name, company name, start date, and application status in a structured table format. The report also includes a chart visualization that represents the number of applications based on their status, such as approved, pending, and rejected. This page helps administrators and placement officers easily analyze internship application data and monitor the overall internship approval process.

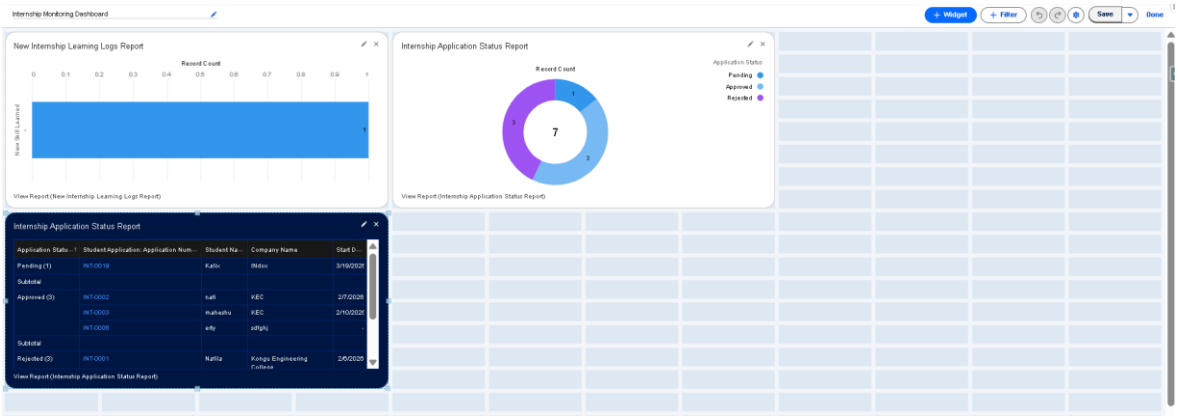

Fig 3.8 Dashboard Page

The Dashboard Page provides a visual summary of the internship management data in the system. It displays charts and reports such as the Internship Application Status Report and Internship Learning Log Report, which show the number of applications and their status in graphical form. This dashboard helps administrators and placement officers quickly monitor internship activities, track student progress, and analyze important data through charts and summarized reports.

3.6 ER DIAGRAM

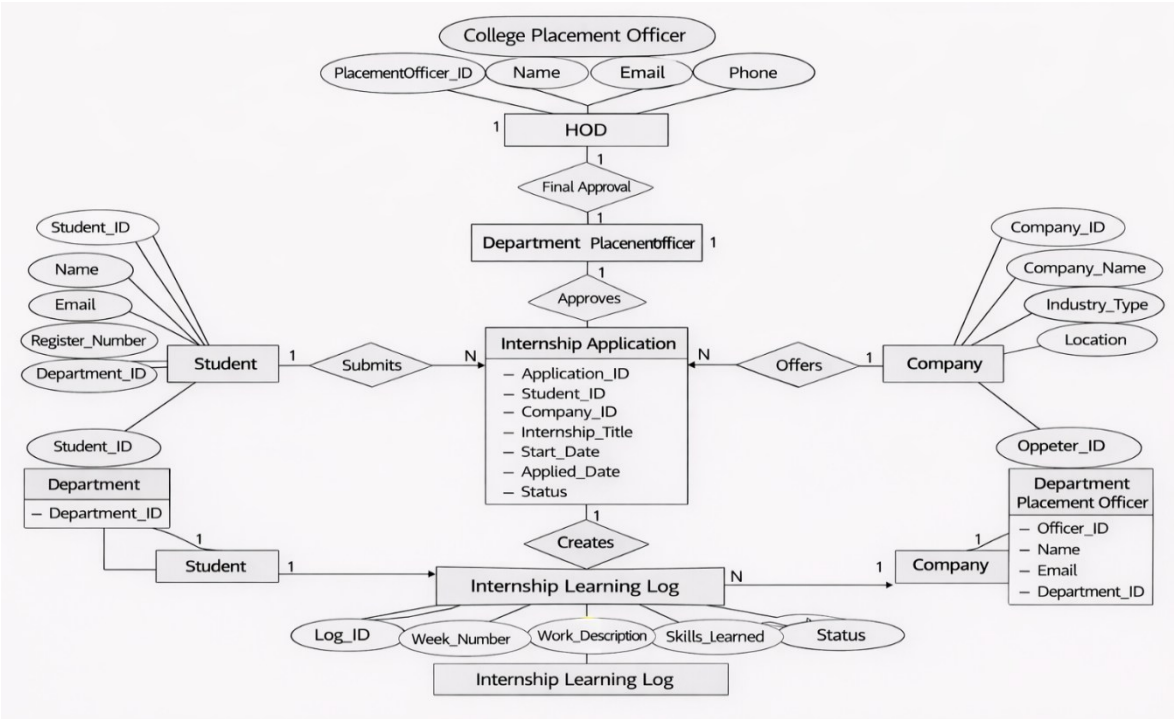

Fig 3.9 ER Diagram

The Entity–Relationship (ER) Diagram represents the structure of the Internship Management System and shows how different entities in the system are connected. The main entities in the diagram are Student, Department, Internship Application, Company, Department Placement Officer, College Placement Officer, HOD, and Internship Learning Log. The Student entity contains attributes such as Student_ID, Name, Email, Register_Number, and Department_ID, and each student belongs to a specific Department. Students submit internship applications through the Internship Application entity, which includes attributes like Application_ID, Student_ID, Company_ID, Internship_Title, Start_Date, Applied_Date, and Status.

The internship application goes through a multi-level approval process involving the Department Placement Officer, HOD, and College Placement Officer. The Department Placement Officer first reviews and approves the application, followed by further approval from the HOD and final approval by the College Placement Officer. Once the internship application is approved, the system creates an Internship Learning Log where students record their internship activities. The learning log includes attributes such as Log_ID, Week_Number, Work_Description, Skills_Learned, and Status, which help track the student's internship progress. This ER diagram clearly illustrates the relationships between entities and shows how the system manages internship applications, approvals, and monitoring of student internship activities.

3.7 DATABASE DESIGN

Database design defines how data is structured, stored, and managed in the Internship Management System. The system database is designed to organize and maintain information related to students, departments, companies, internship applications, and internship learning logs. Each entity in the system is stored as a separate table or object with specific attributes such as Student_ID, Department_ID, Company_ID, Application_ID, and Log_ID. These entities are connected using relationships to ensure that data is stored in a structured and consistent manner.

The database design helps maintain data integrity, reduces redundancy, and improves data retrieval efficiency. For example, the Student table stores student information, the Company table stores company details, the Internship Application table records internship applications, and the Internship Learning Log table tracks the student's internship progress.

3.8 TABLE DESIGN

Table design defines how data is organized into different tables in the database of the Internship Management System. Each table stores specific information related to the system, such as student details, department information, company data, internship applications, and internship learning logs. Every table contains a primary key to uniquely identify each record and foreign keys to establish relationships between tables. This structured organization helps the system store and retrieve data efficiently.

Table 3.1 Student Application

FIELD NAME	DATA TYPE	SIZE	CONSTRAINT
Application_ID	Text	20	PRIMARY KEY
Student_Name	Text	50	NOT NULL
Department	Picklist	-	NOT NULL
Company_Name	Text	50	NOT NULL
Start_Date	Date	-	NOT NULL
End_Date	Date	-	NOT NULL
Application_Status	Picklist	-	NOT NULL

This table stores the details of student internship applications in the system. It includes important information such as student name, department, company name, internship duration, and application status, which helps track and manage internship requests efficiently.

Table 3.2 Internship Learning Log

FIELD NAME	DATA TYPE	SIZE	CONSTRAINTS
Log_ID	Auto Number	-	PRIMARY KEY
Intern_Name	Text	50	NOT NULL
Internship_Application	Lookup	-	FOREIGN KEY
Week_Number	Number	2	NOT NULL
Submission_Date	Date	-	NOT NULL
Faculty_Remarks	Text Area	255	-
Challenge_Faced	Text Area	255	-
New_Skill_Learned	Text	100	NOT NULL

This table stores the weekly progress details of students during their internship. It includes information such as intern name, week number, work challenges, new skills learned, submission date, and faculty remarks, which helps monitor the student's internship learning and performance.

SUMMARY

Chapter 3 explains the system design and overall architecture of the Internship Management System developed using Salesforce. It describes the main modules of the system, including the Student Module, Department Placement Officer Module, HOD Module, College Placement Officer Module, Internship Learning Log Module, and Reports and Dashboard Module. The chapter also presents the system flow, which shows how students submit internship applications, how the applications are reviewed and approved through multiple levels, and how internship progress is monitored through learning logs. In addition, the chapter includes the Entity Relationship (ER) Diagram, which illustrates the entities, attributes, and relationships used in the system database, such as Student, Department, Internship Application, and Internship Learning Log. Overall, this chapter provides a clear understanding of the system structure, data organization, and workflow used to manage and monitor student internships.

CHAPTER 4

IMPLEMENTATION

4.1 CODE DESCRIPTION

The implementation of the Internship Management System is carried out using the Salesforce platform, where most functionalities are developed using declarative tools such as Object Manager, Flow Builder, and Approval Processes. Custom objects including Student, Department, Company, Internship Application, and Internship Learning Log are created to store internship-related information. Each object contains various fields that capture necessary details such as student information, company details, internship duration, and application status. Relationships between these objects are established using lookup fields to maintain proper data connections.

The system automation is implemented using Salesforce Flow and Approval Processes, which are configured using drag-and-drop components. When a student submits an internship application, the system automatically sends the application through multiple approval stages including the Department Placement Officer, Head of the Department, and College Placement Officer. Once approved, students can submit their internship learning logs to track their progress. Reports and dashboards are also created to provide visual insights into internship applications, approvals, and student internship activities.

4.2 STANDARDIZATION OF THE CODING

Standardization of coding ensures that the system is developed in a structured and organized manner so that it is easy to understand, maintain, and update in the future. In the Internship Management System developed using Salesforce, standard naming conventions and design practices are followed while creating objects, fields, flows, and reports. Each object and field is given a clear and meaningful name such as Student, Company, Internship Application, and Internship Learning Log, which helps users easily identify the purpose of each component. The system also follows Salesforce best practices by maintaining proper data relationships, validation rules, and workflow automation to ensure data consistency.

4.3 ERROR HANDLING

Error handling is an important part of the implementation to ensure system stability and a smooth user experience. In the Internship Management System, errors may occur due to invalid user inputs, missing required information, incorrect data entry, or approval process issues. To handle such situations effectively, the system uses structured validation and error-handling mechanisms within the Salesforce platform.

Instead of relying on manual checking by users, the system implements validation rules, required fields, and controlled picklists to ensure that only valid data is entered into the system. For example, important fields such as Student Name, Company Name, Internship Title, Start Date, and End Date must be entered before submitting the internship application. If any required information is missing or incorrect, the system automatically displays an error message and prevents the record from being saved until the issue is corrected. This helps maintain data accuracy and consistency within the system.

Example 1:

If a student tries to submit an internship application without entering required fields such as Company Name or Start Date, the system displays an error message and prevents the record from being saved.

Example message:

"Please fill in all required fields before submitting the application."

Example 2:

If the End Date is earlier than the Start Date, the system shows an error message.

Example message:

"End Date must be greater than Start Date."

Example 3:

If a student tries to submit the same internship application more than once, the system prevents duplicate entries using validation rules.

Example message:

"This internship application already exists."

Example 4:

If an internship application does not meet the required criteria, the system stops the approval process and notifies the user.

Example message:

"Application cannot be approved due to incomplete details."

Additionally, Salesforce Flow error messages and approval process validations are used to manage errors during workflow execution. If an application fails to meet the approval criteria or if incorrect data is entered, the system notifies the user with clear messages so that the issue can be resolved. This structured error-handling approach helps maintain data integrity, system reliability, and an improved user experience throughout the internship management process.

SUMMARY

This chapter explains the implementation of the Internship Management System developed using the Salesforce platform. It describes how the system is built using custom objects, fields, flows, and approval processes. The chapter also explains the code description and standardization practices followed during system development. Proper validation rules and error handling mechanisms are used to ensure accurate data entry. Overall, the implementation helps manage internship applications, approvals, and student internship progress efficiently.

CHAPTER 5

TESTING AND RESULTS

5.1 TESTING

Testing is an important phase in the software development life cycle that ensures the reliability, accuracy, and performance of the Internship Management System developed using the Salesforce platform. This chapter explains the testing methods used to verify that the system meets the required functionality and operates correctly under different conditions. Testing was carried out after the completion of system configuration, including the creation of custom objects, fields, flows, approval processes, reports, and dashboards. The testing results were analysed to ensure that the system performs all intended operations without errors.

The system was tested at different levels to identify and correct possible issues, verify the functionality of individual modules, and ensure proper interaction between system components. Each module, such as internship application submission, approval workflow, internship learning log updates, and report generation, was first tested individually and later tested as part of the complete integrated system.
The testing techniques used in this project include:

- ➤ Unit Testing
- ➤ Integration Testing
- ➤ Validation Testing

5.1.1 Unit Testing

Unit testing focuses on testing individual modules of the system independently to verify that each unit performs its intended functionality correctly. In this project, unit testing was performed during the development phase to ensure that each module of the Internship Management System works as expected. Modules such as Internship Application Submission, Learning Log Entry, Approval Process, and Report Generation were tested separately to identify errors and verify correct functionality.

CASE 1

Module: Internship Application Module

Test Type: Form Submission Verification

Input: Student Internship Details

Output: Internship Application Submitted Successfully

TEST

Input: Student Name, Department, Company Name, Start Date, End Date

Output: Application record created in the system

Analysis: The system successfully stored the application details.

Result: Pass

CASE 2

Module: Internship Learning Log Module

Test Type: Learning Log Entry

Input: Weekly Internship Details

Output: Learning Log Submitted Successfully

TEST

Input: Week Number, Work Description, Skills Learned, Submission Date

Output: Learning log record saved in the system

Analysis: The system correctly recorded the internship progress details.

Result: Pass

CASE 3

Module: Approval Process Module

Test Type: Application Approval Workflow

Input: Submitted Internship Application

Output: Application forwarded for approval

TEST

Input: Internship Application submitted by student

Output: Application sent to Department Placement Officer for approval

Analysis: The approval process moved the application to the next stage correctly.

Result: Pass

CASE 4

Module: Internship Status Tracking Module

Test Type: Status Update Verification

Input: Approved Internship Application

Output: Application status updated

TEST

Input: Approval by placement officer

Output: Application status changed to Approved

Analysis: The system correctly updated the application status.

Result: Pass

CASE 5

Module: Report Generation Module

Test Type: Report Display Verification

Input: Internship Application Records

Output: Internship report displayed

TEST

Input: Generate report option selected

Output: List of internship applications displayed in report page

Analysis: The report generated correctly with accurate data.

Result: Pass

5.1.2 Integration Testing

Integration testing verifies the interaction between multiple modules to ensure that data flows correctly across the system. In the Internship Management System, integration testing was performed to check whether different modules such as Internship Application Submission, Approval Workflow, Learning Log Management, and Report Generation work together correctly. This testing ensures that the data entered in one module is properly transferred and used in other modules without errors.

CASE 1

Module: Student + Internship Application Module

Test Type: Application Submission Flow

Input: Student submits internship application

Output: Application record created successfully

TEST

Input: Enter internship details and click submit

Output: Internship application saved in the system

Analysis: Student details correctly linked with internship application.

Result: Pass

CASE 2

Module: Internship Application + Approval Process

Test Type: Approval Workflow Integration

Input: Submitted internship application

Output: Application forwarded for approval

TEST

Input: Student submits internship application

Output: Application sent to Department Placement Officer for approval

Analysis: Application data transferred correctly to approval workflow.

Result: Pass

CASE 3

Module: Approved Application + Learning Log Module

Test Type: Learning Log Access

Input: Approved internship application

Output: Student allowed to submit learning log

TEST

Input: Student opens learning log form after approval

Output: Learning log record created successfully

Analysis: Learning log module correctly linked with internship application.

Result: Pass

CASE 4

Module: Internship Application + Report Module

Test Type: Report Generation

Input: Internship application data

Output: Internship report displayed

TEST

Input: Generate report option selected

Output: Internship application details displayed in report page

Analysis: Data successfully transferred from application module to report module.

Result: Pass

5.1.3 Validation Testing

Validation testing ensures that the developed system meets the user requirements and performs the intended functions correctly. In the Internship Management System, validation testing was conducted to verify that the system processes user inputs correctly and produces accurate outputs. This testing confirms that the system behaves as expected when valid data is entered and prevents incorrect or incomplete information from being submitted.

CASE 1

Module: Internship Application Form

Test Type: Required Field Validation

Input: Missing required fields

Output: Error message displayed

TEST

Input: Submit application without entering company name

Output: Error message displayed requesting required field

Analysis: System correctly prevents submission with missing details.

Result: Pass

CASE 2

Module: Internship Date Validation

Test Type: Date Verification

Input: End Date earlier than Start Date

Output: Error message displayed

TEST

Input: Start Date: 10/06/2026, End Date: 05/06/2026

Output: Validation error shown

Analysis: System correctly validates date fields.

Result: Pass

CASE 3

Module: Learning Log Submission

Test Type: Input Validation

Input: Valid internship learning log details

Output: Learning log saved successfully

TEST

Input: Week number, skills learned, submission date

Output: Learning log record created

Analysis: System accepts valid data and stores it correctly.

Result: Pass

CASE 4

Module: Application Status Update

Test Type: Status Validation

Input: Approved internship application

Output: Status updated correctly

TEST

Input: Approval by placement officer

Output: Status changed to Approved

Analysis: System correctly validates and updates application status.

Result: Pass

SUMMARY

This chapter describes the testing performed on the Internship Management System to ensure correct functionality and reliability. Unit, Integration, and Validation testing were conducted to verify system modules and data flow. The results confirm that the system works properly and meets the required user needs.

CHAPTER 6

CONCLUSION AND FUTURE ENHANCEMENTS

6.1 CONCLUSION

The Internship Management System developed using the Salesforce platform provides an efficient and organized solution for managing student internship activities within an educational institution. The system simplifies the process of submitting internship applications, reviewing them through a structured approval workflow, and monitoring student internship progress. By digitalizing the internship management process, the system reduces manual work, improves data accuracy, and allows administrators to track internship information more effectively. Students can easily submit their internship details, while placement officers and department authorities can review and approve the applications through a centralized system.

The system is designed using various Salesforce features such as custom objects, fields, flows, approval processes, reports, and dashboards. The approval process allows internship applications to pass through multiple levels such as the Department Placement Officer, Head of the Department, and College Placement Officer, ensuring proper verification before approval. Once the internship is approved, students can update their internship learning logs, which allows administrators to monitor the progress and learning outcomes of the students during their internship period. Another important advantage of the system is the ability to generate reports and dashboards that provide valuable insights into internship activities.

Overall, the Internship Management System provides a reliable and user-friendly platform for managing internship processes in a systematic manner. The system enhances communication between students and placement authorities, ensures efficient approval workflows, and helps track internship learning activities. By implementing this system, institutions can manage internship data more efficiently, reduce administrative workload, and improve the overall internship management experience for both students and administrators.

6.2 FUTURE ENHANCEMENTS

Although the Internship Management System provides an effective platform for managing internship applications, approvals, and monitoring student progress, several additional features can be implemented in the future to further enhance the system. One possible enhancement is the development of a company portal, where companies can directly register in the system and post internship opportunities. Through this feature, companies will be able to view student profiles, review internship applications, and select suitable candidates for internships. This will improve collaboration between educational institutions and companies and make the internship selection process more efficient.

Another possible improvement is the addition of an internship performance evaluation module. In this module, internship supervisors or faculty members can evaluate students based on their performance during the internship period. The evaluation can include criteria such as work quality, communication skills, teamwork, and learning ability. The evaluation results can be stored in the system and used as part of the student's academic or placement record. This feature will help institutions better understand student performance and encourage students to actively participate in their internship activities.

The system can also be enhanced by implementing AI-based internship recommendations. This feature can analyse student profiles, academic background, and skills to suggest suitable internship opportunities automatically. Such a recommendation system will help students identify relevant internship opportunities more easily and improve their chances of gaining practical industry experience.

In addition, future enhancements may include stronger security and access control mechanisms to ensure better protection of system data. Features such as multi-factor authentication and role-based access control can help prevent unauthorized access to sensitive information. The system can also be integrated with external platforms such as job portals or company recruitment systems, allowing internship opportunities to be shared and managed more efficiently.

Overall, these future enhancements will help expand the functionality of the Internship Management System and make it user-friendly, and beneficial for students and institutions.

SUSTAINABLE DEVELOPMENT GOALS (SDGS)

SDG 4 – Quality Education

- Provides students with a structured digital platform to apply for and manage internship opportunities.
- Helps students gain practical industry experience, improving their professional skills and career readiness.
- Supports experiential learning by allowing students to track internship activities through learning logs.
- Encourages institutions to adopt digital systems for academic and internship management.

SDG 8 – Decent Work and Economic Growth

- Helps students gain real-world work experience through internships, improving employability.
- Facilitates better coordination between students, institutions, and companies for internship opportunities.
- Supports career development by allowing students to showcase their internship experience and skills.
- Encourages institutions to prepare students for professional environments and future employment.

SDG 9 – Industry, Innovation, and Infrastructure

- Built using the Salesforce cloud platform, providing a scalable and secure digital infrastructure.
- Utilizes automation tools such as flows, approval processes, and dashboards to improve operational efficiency.
- Supports digital transformation of internship management in educational institutions.
- Encourages the use of modern cloud-based technologies for academic administration.
